

## Reportable Infectious Diseases in Clark County, Ohio

This report summarizes Reportable Infectious Diseases in Clark County Ohio from 2013 to 2023. Details about select categories and specific diseases of interest are included as well. Unless otherwise noted, all case counts and case rates were retrieved from the Ohio Disease Reporting System (ODRS) and include confirmed and probable cases of disease. Yearly population estimates were retrieved from the United States Census Bureau.

**Population estimates used in this report are based on the US Census Bureau which may not be an accurate reflection of the current number of people in Clark County due to substantial population growth since 2020. Case rates are directly impacted by the total population number, and therefore case rates presented here may be higher than the actual case rate for Clark County. For example, if there are 50 cases of disease X in a population of 134,500, this is a rate of 37 cases of disease X for every 100,000 people. However, if the actual population is 12,000 higher (a total population of 146,500), the rate of disease X would be 34 cases for every 100,000 people.**
